InCommand Mitiga

How it works — two scenarios, and how it scales

Not every emergency is a disaster · and how local ties into provincial and national

DRAFT
16 October 2026

Routine / daily ops | **Emergency** agency responds | **Human declaration** JOC · the gate | **DISASTER** full ICS activates

The line between an emergency and a disaster is a deliberate human decision in the JOC — never automatic. That gate is the cost control: it stops a routine incident triggering an expensive full multi-agency mobilisation.

1 An everyday emergency — a car crash, a structure fire, a medical call (most incidents)

stays local · JOC never declares

Incident / call comes in → CAD routes it in-platform → Right agency responds (+ site pre-plan) → Crews on scene · bodycams · trackers → Resolved — handled by the agency

2 It escalates to a disaster — a factory fire that spreads, a major flood, an event beyond local capacity

full ICS · multi-agency · climbs the tiers

Incident exceeds capacity → JOC declares a DISASTER (human gate) → Dormant pre-plan activates → full ICS → All agencies · Unified Command → Rolls up: province → national

How it scales — local ties into provincial and national (built now, national in Phase 3)

LOCAL · DISTRICT
Ehlanzeni
Where it happens — CAD, JOC, agencies and ground. Every emergency is handled here.

escalate ↑ ↓ resources ↓

PROVINCIAL
Mpumalanga PDMC
Oversight across the 3 districts. Pulls cross-district mutual aid; rolls incidents up to national.

national ↑ ↓ oversight ↓

NATIONAL
NDMC
National disaster classification, cross-province mutual aid and oversight for the biggest events.

The rule: emergencies stay local (scenario 1). Only declared disasters climb the tiers (scenario 2) — rolling up for oversight and pulling mutual aid from other districts or provinces when the incident outgrows local capacity. The hierarchy is built into the data model from day one; provincial and national come online in Phase 3.
