InCommand Mitiga

Incident workflow — from the call to the conclusion

If we adopt the ICS / FEMA structure · the operational flow end to end

DRAFT for planning
15 October 2026

0 · Pre-incident
Risk, planning & mitigation

R1 Site & risk surveys
DXF floor/site plans · fire & life-safety · flood lines

R2 Build & share pre-plan
Zones, hazards, hydrants mapped · shared to agencies (per site / per agency)

→ Dormant event waits inside JOC until needed · agencies already hold the plan

1 · Call & emergency
Call-taking & dispatch (CAD)

C1 Call received
Incident record · number · timestamp

C2 Caller intelligence
History + speech-to-text call summary

C3 Locate & plot
Map the emergency · ANI/ALI location

C4 Classify
Type & priority

C5 Route to agencies
In-platform request → the right agency's control-room dashboard (ER24 / Fire / Police)

◇ Handled as an emergency?
Yes → resolve & close (stays an emergency)
No / bigger → escalate to JOC ↓

2 · Escalation
JOC — Command

E1 JOC assesses
Scale, risk to life, resources needed

◆ GATE · Human declares DISASTER
Never automated — this is the cost control

E2 Activate event — from Risk
Pull matching dormant pre-plan → fully populated

E3 Stand up command
Establish ICP · org with span of control

E4 Public warning — CAP
Geo-targeted alert to red zones

3 · Operational period — the Planning P
JOC — all 5 ICS sections

P1 Size-up & safety — 208 / 215A
Safety Officer · ArcGIS hazard layers

P2 IC sets objectives — 202
What will be accomplished

P3 Incident briefing — 201
Situation + resources to command staff

P4 Tactics meeting — 215 / 215A
Operations: strategy → tactics

P5 Assignments — 204
Deploy field + ground resources

P6 Compile IAP — 202+205+206+208
Objectives + comms + medical + safety

P7 Execute operational period
Monitor COP · bodycam/RoIP · tracking · field intel. Logistics orders (215), Finance tracks cost.

◇ Objectives met?
No → ↻ new operational period (back to P1)
Yes → wind down ↓

Forms auto-populate across the cycle (enter once) · ↔ roadmap: request mutual aid from an adjacent region / province

4 · De-escalation & conclusion
JOC — Planning + Finance

D1 De-escalate
Step the response back down

D2 Demobilisation plan
Orderly release & check-out of resources

D3 Close incident
Stand down · final status

D4 After-action & reconcile
AAR + cost reconciliation (Finance) + archive

↩ Lessons feed back into Risk pre-plans

Running across every phase (always on)

Partner agencies — ER24 / Fire / Police / EMS on the platform, each with its own control-room dashboard; requests routed in-system (Unified Command).

Ground control — bodycams + Virtual PBX/RoIP (JOC listen-in) + distress, feeding JOC & CAD.

Tracking server — Teltonika vehicles + BLE assets → live positions on the shared map.

Shared core — multi-agency tenancy (district → province → national), RBAC, map, comms, event bus, audit.

Resilience: each node runs offline-first — if the WAN link or national internet drops, the building keeps working on local data and the cross-section links degrade to analog. The flow above never stops; it just loses live sync until the link returns.

Actor: Risk · CAD · JOC Command · Operations · Planning · Finance — Decision · Human gate — ICS form numbers shown on the relevant step.
