InCommand Mitiga

More scenarios — pre-planning, and mutual aid at scale

Companion to scenarios 1 & 2 (everyday emergency · escalating disaster)

DRAFT
16 October 2026

The first two scenarios showed the **everyday emergency** (stays local) and the **escalating disaster** (climbs the tiers). These two show where the platform really pays off: **planning ahead**, and **pulling help across regions** when one district or province can't cope alone.

3 A pre-planned seasonal disaster — flood season: a known, seasonal hazard, planned months ahead

pre-planning cuts response time dramatically

Risk builds a flood-season pre-plan → **Sits dormant in JOC · shared to agencies** → **Trigger: SAWS warning or flood onset** → **One click → plan fully populated** → **Coordinated response in minutes, not hours**

4 A disaster that needs mutual aid — an event that outgrows one district, then one province

the more on the platform, the stronger the response

Major disaster — beyond local capacity → **Ehlanzeni's own resources exhausted** → **Province pulls other districts (Gert Sibande · Nkangala)** → **Still short? National pulls other provinces (Gauteng +)** → **Coordinated multi-region response · Unified Command**

Why these two matter for the pitch: Scenario 3 is the whole case for the Risk pillar — the pre-plan is already built, dormant and shared, so when the hazard hits the response is instant instead of starting from scratch (and it's a product you sell to businesses). Scenario 4 is your network-effect thesis made real — **the more districts, provinces and agencies on the platform, the more resources every member can draw on** through mutual aid. Both run on the same hierarchy (district → province → national) that we build into the data model now; cross-province aid comes fully online with national in Phase 3.
